

User Story 3: Search Handling and Layout

As a user, I want to be able to search for a player and have all the information presented to me by the webapp be displayed on the same page. The search bar should remain where it is after a search, with the song recommendations displayed below it, and the player information displayed below that. This way, I can readily get the main information I use the webapp for, the songs, and can easily scroll down further for auxiliary player information. I would also be able to easily make another search if needed. If I happen to search for a player or region that is invalid, I want to be notified by the webapp and be told which part of the search was problematic (player or region).
