

### Tech Stack: Django

For this webapp, we considered using either Django or Flask, mainly due to the time limitation that came with changing requirements late into the game. Since we were mostly familiar with Python, we would be able to jump in and get to creating an application straight away according to the changing requirements. In line with this, we ended up choosing to go with the batteries-included Django which would most likely save us the time spent planning the app's framework before development. The customizability of Flask applications also likely wouldn't be needed for the simple one-page webapp we had in mind, and the framework that Django provides along with its vast online community and documentation allowed us to quickly spring into development despite having no prior experience with web development.
