

User Story 5: Recent Search History

As a logged-in user, I want to be able to see up to 5 of my most recent player searches, ordered from most recent to least recent. Each search display should contain the name of the searched player and their region. I want to be able to click on one of these displays and automatically be presented with the information about that particular player, as if I had manually searched for that player through the text field. Each time I search a player, whether it be through the text field or by clicking on a previous search, the displayed search history should update to preserve the most-to-least recent ordering. If there are 5 entries in the search history and I search for a player that is not one of those 5, then the least recently searched player should be evicted from the search history to make room for the newly searched player. This history information should persist between logged-in sessions.
